

Risk & Opportunity Management

Comparability of risks and opportunities across the company!

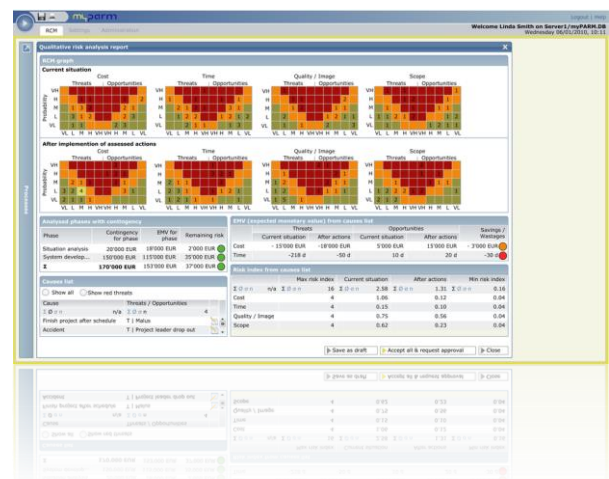

Our risk and opportunity management solution provides you with systematic support regarding your project risks and opportunities as follows: Recording, analysing and taking measures to minimise risks or increase opportunities and judging the risk situation of the projects as a basis for decisions (go/no go).

Our solution makes an important contribution to corporate success by ensuring pointing out and making aware of the risk sources and which risks are driven internal or external.

Within our risk and opportunity solution, you have all your risks and opportunities under control!

Topics

Identifying opportunities and risks, risk analysis, risk assessment, task management/risk management/risk control, ongoing supervision/monitoring, risk recording, reporting, Monte Carlo simulations

Product versions and applications

A risk policy must be implemented to successfully support the claims of the company management. myPARM ROM supports a company-specific risk atlas (top-down approach), roles, escalation criteria, processes for identifying and handling risks, and the mechanisms used to monitor the success of the measures taken to reduce risks.

Thanks to the top-down approach and company-wide risk atlas, risks and opportunities can be compared across the company.

The ROM supports the risk and opportunity management process and guides the user through each process step (workflow driven). The processes may be adapted to the object – an assistant adjusts the risk management process to each specific need.

To prevent high additional costs within risk management, all processes, user interfaces, graphical and tabular data are clearly presented. The sizes, types and phases of the business object are considered, i.e. low-risk objects have to be executed more quickly and easily than high-risk objects.

The system is highly flexible and adaptable to all new risks and opportunities arising across the company.

Flexible assessment of risks and approval expiry: risks can be assigned not only to objects but also to individual tasks, risk categories, object types and phases.

Further advantages

- The management system can be «tailored» to meet your individual requirements. Apply our best practice approaches or develop them further with our help to meet your individual needs.
- Clear layout and intuitive user guidance – myPARM ROM is highly user friendly and equally accessible to non-technical users.
- Constant transparency (including graphical presentations) of the success of planned and implemented measures.
- Improved decision-making thanks to «historical movement analysis» (consideration of past and future). Decisions are based on reliable data and empirical values.
- After the figures have been transferred periodically from your operational IT system, the data gets stored in the ROM-own department store according to the SQL standard.
- Content management/integrated document management.
- The application is web-based.
